Distribution and Source of Nebraska Agricultural Statistical Data ..... Inside Back Cover

PREFACE

Information in this statistical summary of Nebraska agriculture is the result of thousands of voluntary reports from farmers, ranchers and agribusiness firms. Much of the detail needed for county estimates was collected from farmers and ranchers by mail with the Annual Agricultural Survey and acreage and livestock surveys. County extension staff, local lending institutions and the National Weather Service have also contributed through weekly reports on weather and crops. The excellent cooperation from all the above mentioned and other State, University and USDA agencies is very much appreciated.

The Nebraska Department of Agriculture and the United States Department of Agriculture cooperate in collecting and compiling these agricultural statistics. Under this cooperative agreement, the Nebraska Agricultural Statistics Service publishes over 100 statistical reports annually covering most Nebraska agricultural commodities.

Livestock and number of farms estimates were prepared by Dennis Johnson. Crop estimates were prepared by Marv Anderson, Mike Pallesen, and Steve Larsen. Dan Capstick was responsible for poultry and price estimates. David Mueller, Andrea Parks, and Suzan Benz were responsible for much of the survey data collection activity and computer programming to assist in processing regular monthly reports and other State Department of Agriculture activities. Bill Dobbs supervised the technical staff, reviewed estimates and book contents.

The organization and tabular material were prepared by Mrs. Charlotte Rowe, who also coordinated the typing, assembling, proofreading and checking of this book. Many other hours of statistical computation and verification work were accomplished by the clerical staff.

This publication provides Nebraska county, agricultural statistics district and State data on selected agricultural items most used by agricultural data users. Selected data are also shown for the U.S. and special State groupings.

For 1987, county estimates for most crops are provided. However, only statistical district estimates for wild and other tame hays, irrigation, number of farms and all livestock are provided due to a recent reduction in State funds for agricultural statistics. All 1987 estimates are preliminary and subject to revision. Revised estimates for 1985 and 1986, for most data series, are published in this publication, while county crop and livestock estimates for prior years and most other statistics about agriculture are available upon request.

To request releases with current agricultural statistics issued during the year or additional copies of this report, please complete and return the appropriate (Free or For Pay) Subscription Request Form shown in the back of this report.

STATISTICAL METHODS

GENERAL

The Nebraska Agricultural Statistics Service has two primary objectives:

1. To develop accurate, reliable agricultural statistics.
2. To move those statistics to users as rapidly as possible.

Data collection to achieve these objectives involves sample surveys of farmers and ranchers, grain companies and elevators, auctions, packing plants, retail stores, and many other agricultural enterprises.

From data reported by these many sources, statisticians, using all available statistical tools, generate State totals forming official State and USDA estimates. Cooperation of USDA and the Nebraska Department of Agriculture provides resources for distribution of State totals into agricultural statistics district and county estimates.

Analysis and interpretation of these basic statistics are performed by others, such as University of Nebraska Extension Specialists, private economists, and the producer. Our role is to provide basic data and every effort within available resources is made to provide accurate and timely information. This process begins with survey design and continues through data collection, summarization, analysis and finally the release of the crop and livestock statistics.

STATE ESTIMATES

The U.S. Department of Agriculture is required by law to provide National crop and livestock statistics for each major producing State.

For many years, mailed non-probability surveys served as the backbone of data gathering and they are still used to some extent. Today, probability sampling, a more sophisticated sampling procedure, is being incorporated as funds and applied technology allow. Some types of probability sampling used in Nebraska are Area Frame Sampling, List Frame Sampling, and Multiple Frame Sampling. Sampling farm operators in a specifically outlined geographic area is known as Area Frame Sampling, while sampling a list of all known producers of a specific commodity is known as List Frame Sampling. A technique called Multiple Frame Sampling takes advantage of the attributes of both the Area and List samples. Area Frame Sampling is used in Nebraska for most crop acreage and livestock items and Multiple Frame Sampling is used for estimating major crop and livestock items.

The concept of probability sampling is maintained in all three types of sampling. Data collection for the probability surveys involves personal enumeration and telephone or personal followup for all non-respondents to mail questionnaires. These probability surveys are expensive on a per sampling unit basis but yield State results that have greater precision and allow measurement of the sampling error. Good cooperation from survey respondents contributes heavily to accuracy.

Three of Nebraska's major crops (corn, soybeans and wheat) are measured by objective yield procedures. Forecasts before harvest incorporate plant counts, kernel and head counts and weight. Sample fields are entered with permission of growers, by field enumerators from May through October to take counts and measurements during the growing season. After harvest, gleaning provides estimated harvesting loss. Monthly crop reporters give dependable mail survey yield indications during the season.

COUNTY ESTIMATES

Federal appropriations and regulations support State estimates for specific agricultural items that are important in National totals and some county level estimates. When additional items or geographic descriptions within States are needed, supplemental funding is required. To provide estimates by county, for example, requires a much larger sample because each county must have enough reports to provide a sound basis for estimates. Our acreage surveys and Annual Agricultural Survey give every operator a chance to report annually and provides a solid basis for county estimates.

CHECK DATA

In addition to producer surveys, check data are collected from the marketing channels, county extension agents, ASCS, etc., to verify or supplement the grower survey data. These data become available -- usually long after harvest and are used to establish final production and marketing figures.

The final estimate is arrived at when all grower survey data and marketing data (check data such as: handler or processor receipts, slaughter, and market shipments) have been analyzed. These data then become the statistical history against which current forecasts and estimates are viewed.

CHRONOLOGY OF THE NATIONAL AGRICULTURAL STATISTICS SERVICE

1839 Congress appropriates $1,000 to Patent Office for "collection of agricultural statistics and distribution of seeds."

1841 Using 1840 Agricultural Census as a benchmark, Patent Office issues first crop report. Annual releases continue until 1848.

1856 Orange Judd, Editor of "The American Agriculturalist," collected and published crop conditions until transferred to USDA in 1863.

1862 U.S. Department of Agriculture established.

1863 Division of Statistics formed in USDA as predecessor of today's NASS. First crop report issued in July.

1866 Beginning of continuous series of reports on major crops, livestock, and agricultural prices.

1882 Part-time statisticians appointed to develop and maintain group of voluntary crop reporters and provide current information on agriculture.

1892 Now 15,000 farm-reporters provide data for monthly surveys, and 125,000 furnish survey data for annual estimates.

1898 State Statistical agents appointed to cover groups of States.

1903 In addition to crop reporters, 61,000 ginners, 24,000 millers and elevator operators, and 22,000 agents of railroads and transportation companies report on agriculture.

1905 Agricultural Statistics Board, a group of highly qualified agricultural statisticians from Washington, D.C. and field offices, established to review information and set national and state estimates.

1908 Monthly reports begin on prices farmers receive for their products.

1909 Congress specifies which crops will be covered in crop report, stipulates issuance times, and requires Secretary of Agriculture to sign report. Statisticians, staff, and other workers prohibited by law from making premature disclosure of crop estimates, issuing false reports, or speculating on commodity market.

1910 Begin collecting Prices Paid by Farmers in 74 commodities.

1914 Full-time State Statisticians established.

1917 Wisconsin signs first formal agreement establishing cooperative Federal-State crop-estimating program. (Agreements in effect with 48 States by 1967.)

1919 South Carolina statistician does first fieldwork on objective measurements of crop acreages (now a significant element in NASS crop estimating). Potato stocks reports begin.

1923 Livestock reporting work expanded.

1925 First 5-year census of agriculture taken; previously taken every 10 years.

1926 Quarterly farm grain stocks begin.

1927 Decentralization of data collection started transferring all mail lists to the States.

1928 Objective measurements for forecasting yield start with cotton; corn and wheat later, but are discontinued at the start of World War II.

1933 Price statistics expanded. Parity prices computed.

1943 Quarterly estimates of grain stocks off farms in mills and elevators begin.

1945 Forerunner of today's enumerative surveys launched with interviews of 20,000 farmers in 158 counties and 42 states concerning farm labor.

1954 June enumerative survey of crop acreages opens on research basis in 10 States, 100 counties, and 703 segments.

1956 First comprehensive farm production expenditures survey conducted.

1962 Objective yield surveys for wheat become operational, providing the ASB with additional indications of yield per acre.

1962 NASS begins use of computers. Data Processing Branch created.

1966 Continuous crop and livestock estimating program enters second century.

1974 NASS participates with NASA and NOAA in the Large Area Crop Inventory Experiment, a major inter-departmental effort to demonstrate the potential of satellite data and weather data for use in worldwide crop production estimation and forecasting for wheat.

1978 AgRISTARS, under the leadership of NASS, developed as an interagency research program to evaluate the potential of aerospace remote sensing data in meeting USDA information needs.

1979 List frame, a standardized method for building and maintaining a list of names for sampling, becomes operational.

1982 NASS estimating program modified because of budget constraints. Available resources redirected toward maintaining timely and available data series judged to be the most important in monitoring changes in the agricultural sector.

1983 NASS developed its second comprehensive, long-range plan for improved statistical standards, integrated survey programs, and data management systems.

1986 USDA changes the name of Statistical Reporting Service to National Agricultural Statistics Service to more accurately reflect the purpose of the agency and its broad agricultural focus.

1987 "FACT FINDING FOR AGRICULTURE - 125 YEARS OF SERVICE". NASS celebrates 125 years as the leader in providing crop and livestock statistics.
